FUND MANAGER'S COMMENTS

For the month, the fund rose +0.53% in MYR terms, underperforming the benchmark by -60bps. The underperformance of the month was driven by Information Technology, Utilities and Real Estate.

FBMKLCI lost 0.75%. Investors remain wary of the sustained weakness of the Ringgit and a rather uninspiring 1Q23 corporate results. Malaysia's PMI reading for June was 47.7pts vs 47.8pts in May. Malaysia's economy expanded 5.6% YoY in 1Q23. The strong growth was contributed by further expansion of household spending, continued investment activity, improving labor market and higher tourism activities. We prefer to maintain a cautious stance and continue to adopt a barbell strategy, balancing between value and growth, though we saw opportunity on selective sectors post the recent market sell-down. We are constructive on domestic-driven sectors, such as Utilities and REITS, while we continue to like structural growth themes in selective Technology. Furthermore, in view of a stronger rebound in tourist arrivals post-reopening in China, we also like airport and tourism-related stocks.

The MSCI AC Asia Pacific ex Japan Index rose 2.6% in USD terms in June, almost reversing the loss last month. Australia and India were among the best performing markets. The US10-year bond yield ended the month higher at 3.84%, up 20bps and the Dollar Index depreciated by 1.36%. The US headline CPI continues to moderate but core inflation is stickier, remaining above 5%. US Fed chose not to raise rates in June, but the revised dot plot showed a peak Fed fund rate of 5.6% this year, implying 2 more rate hikes. We maintain the view that we are near the end of rate hike cycle. Going forward, the impact of the aggressive tightening in monetary policy will weigh on credit flow and consumer spending in the US. Our base case is a mild recession in US, possibly in 4Q23.

We have a positive view on Asian equities given attractive investment themes and corporates have the potential to post better earnings growth than developed markets. We will continue diversify the portfolio and to focus on quality companies which have good earnings visibility, robust balance sheet, long term winners, market share gainers and those with pricing power to overcome cost pressures.

RISKS

All investment carries some form of risks. The potential key risks include but are not limited to the following:

Stock specific risk	Prices of a particular stock may fluctuate in response to the circumstances affecting individual companies such as adverse financial performance, news of a possible merger or loss of key personnel of a company. Any adverse price movements of such stock will adversely affect the target fund's NAV.
Credit and default risk	The target fund will be exposed to a certain degree of credit and default risk of issuers or counterparties when the target fund invests in debt securities, money market instruments and/or place deposits. Credit risk relates to the creditworthiness of the securities issuers or counterparties and their expected ability to make timely payment of interest and/or principal. Any adverse situations faced by the issuers or counterparties may impact the value as well as liquidity of the investments. In the case of rated debt securities, this may lead to a credit downgrade. Default risk relates to the risk that a securities issuer or counterparty either defaulting on payments or failing to make payments in a timely manner which will in turn adversely affect the value of the investments. This could adversely affect the value of the target fund. We aim to mitigate this risk by performing bottom-up and top-down credit research and analysis to determine the creditworthiness of its issuers or counterparties, and impose investment limits on exposures for issuers or counterparties with different credit profiles as a precautionary step to limit any loss that may arise directly or indirectly as a result of a defaulted transaction.
Interest rate risk	Interest rate risk refers to the impact of interest rate changes on the valuation of debt instruments and money market instruments. When interest rates rise, debt instruments and money market instruments prices generally decline and this may lower the market value of the target fund's investment in debt instruments and money market instruments. In managing the debt instruments, we take into account the coupon rate and time to maturity of the debt instruments with an aim to mitigate the interest rate risk. As for money market instruments, the typical tenor of these instruments are less than 12-month maturity and unlike debt instrument, any change to interest rate will only have a minor impact to the prices of these instruments.
Country risk	Investments of the target fund in any country may be affected by changes in the economic and political climate, restriction on currency repatriation or other developments in the law or regulations of the countries in which the target fund invests in. For example, the deteriorating economic condition of such countries may adversely affect the value of the investments undertaken by the target fund in those affected countries. This in turn may cause the NAV of the target fund or price of units to fall.

RISKS

All investment carries some form of risks. The potential key risks include but are not limited to the following:

Currency risk

As the investments of the target fund may be denominated in currencies other than the base currency of the target fund, any fluctuation in the exchange rate between the base currency of the target fund and the currencies in which the investments are denominated may have an impact on the value of these investments. You should be aware that if the currencies in which the investments are denominated depreciate against the base currency of the target fund, this will have an adverse effect on the NAV of the target fund in the base currency of the target fund and vice versa. You should note that any gains or losses arising from the fluctuation in the exchange rate may further increase or decrease the returns of the investment.

Risk of investing in emerging markets

In comparison with investments in the developed markets, investment in emerging markets may involve a higher degree of risk due to the greater possibility of political or economic instability and societal tensions. Emerging markets are markets that are, by definition, "in a state of transition" and are therefore exposed to rapid political change and economic declines. The securities in the emerging markets may face a higher risk of price drop while the exchange rates in these emerging markets are generally more volatile than those of developed markets. As such, you should be aware that investments in emerging markets may subject to higher price volatility and therefore will tend to have a higher investment risk that will affect the target fund's growth. We attempt to mitigate these risks through active asset allocation management and diversification across different countries and sectors, in addition to our continuous bottom-up and top-down research and analysis.

Risks associated with investment in warrants

There are inherent risks associated with investment in warrants. The value of warrants is influenced by the current market price of the underlying security, the exercise price of the contract, the time to expiration of the contract and the estimate of the future volatility of the underlying security's price over the life of the contract. Generally, the erosion in value of warrants accelerates as it approaches its expiry date. Like securities, we will undertake fundamental research and analysis on these instruments with an aim to mitigate its risks.
