FUND MANAGER'S COMMENTS

During the month, the Fund gained 6.26% in MYR terms, outperforming the benchmark by 1.53%.

The MSCI AC Asia Pacific ex Japan Index surged 9.8% in May in USD terms. After a correction during mid May due to rise in interest rates rhetoric with the US 10-year bond yields rising almost 30bps amid inflation concerns, Korea and Taiwan ROC led the rally again in Asian equities. Strong first quarter earnings, leading to earnings upgrades drove the technology sector in Korea and Taiwan ROC. On the other hand, Indonesia and China underperformed. US 10- year bond yields end the month at 4.44%, a rise of 12 bps MoM. The USD appreciated by 0.9% MoM while Brent price retreated to below US\$100/bbl to end the month at US\$92/bbl on renewed hopes that a deal can be reached between the US and Iran.

Asian equities are a beneficiary of more pro-risk markets due to it being under-owned, world-class hardware tech exposure, strong earnings growth, and reasonable valuations. We recommend buying risk assets on meaningful dips. We will continue to hold a diversified portfolio and focus on companies with quality growth, high free cashflow, and/or improving capital management. We prefer technology, materials and industrials with exposure to defense, nuclear, power equipment.

The FBM100 Index fell 1.14% in April. Sentiment continues to be dictated by the war in the Middle East and consequently its inflationary effects and influence of US fed rate trajectory. Prospects of a US-Iran accord saw energy and broad commodity prices easing notably from recent peaks, but tensions remain. Malaysia saw broad-based declined, with Financials, Consumer, commodity-related sectors reeling, with select Utilities, Building Mats and Healthcare posting positive gains. Tech continues to outperform buoyed by the global AI theme.

We continue to adopt a barbell strategy in light of the uncertain global backdrop. Our portfolio is anchored in companies with solid domestic earnings visibility, offering resilience against external volatility while we selectively add undervalued names with clear recovery drivers. We also maintain tactical positions in beneficiaries of elevated oil prices and sector leaders poised to capitalize on favourable industry trends. Our core focus remains in the Financials, Utilities and Industrials space complemented by technology and selective exposure to O&G. Key risks include the potential setback of Malaysia's macroeconomic recovery and corporate earnings driven by elevated inflation, slower global growth, and rising geopolitical tensions.

RISKS

All investment carries some form of risks. The potential key risks include but are not limited to the following:

Stock specific risk	Prices of a particular stock may fluctuate in response to the circumstances affecting individual companies such as adverse financial performance, news of a possible merger or loss of key personnel of a company. Any adverse price movements of such stock will adversely affect the target fund's NAV.
Credit and default risk	The target fund will be exposed to a certain degree of credit and default risk of issuers or counterparties when the target fund invests in debt securities, money market instruments and/or place deposits. Credit risk relates to the creditworthiness of the securities issuers or counterparties and their expected ability to make timely payment of interest and/or principal. Any adverse situations faced by the issuers or counterparties may impact the value as well as liquidity of the investments. In the case of rated debt securities, this may lead to a credit downgrade. Default risk relates to the risk that a securities issuer or counterparty either defaulting on payments or failing to make payments in a timely manner which will in turn adversely affect the value of the investments. This could adversely affect the value of the target fund. We aim to mitigate this risk by performing bottom-up and top-down credit research and analysis to determine the creditworthiness of its issuers or counterparties, and impose investment limits on exposures for issuers or counterparties with different credit profiles as a precautionary step to limit any loss that may arise directly or indirectly as a result of a defaulted transaction.
Interest rate risk	Interest rate risk refers to the impact of interest rate changes on the valuation of debt instruments and money market instruments. When interest rates rise, debt instruments and money market instruments prices generally decline and this may lower the market value of the target fund's investment in debt instruments and money market instruments. In managing the debt instruments, we take into account the coupon rate and time to maturity of the debt instruments with an aim to mitigate the interest rate risk. As for money market instruments, the typical tenor of these instruments are less than 12-month maturity and unlike debt instrument, any change to interest rate will only have a minor impact to the prices of these instruments.
Country risk	Investments of the target fund in any country may be affected by changes in the economic and political climate, restriction on currency repatriation or other developments in the law or regulations of the countries in which the target fund invests in. For example, the deteriorating economic condition of such countries may adversely affect the value of the investments undertaken by the target fund in those affected countries. This in turn may cause the NAV of the target fund or price of units to fall.

RISKS

All investment carries some form of risks. The potential key risks include but are not limited to the following:

Currency risk	As the investments of the target fund may be denominated in currencies other than the base currency of the target fund, any fluctuation in the exchange rate between the base currency of the target fund and the currencies in which the investments are denominated may have an impact on the value of these investments. You should be aware that if the currencies in which the investments are denominated depreciate against the base currency of the target fund, this will have an adverse effect on the NAV of the target fund in the base currency of the target fund and vice versa. You should note that any gains or losses arising from the fluctuation in the exchange rate may further increase or decrease the returns of the investment.
Risk of investing in emerging markets	In comparison with investments in the developed markets, investment in emerging markets may involve a higher degree of risk due to the greater possibility of political or economic instability and societal tensions. Emerging markets are markets that are, by definition, “in a state of transition” and are therefore exposed to rapid political change and economic declines. The securities in the emerging markets may face a higher risk of price drop while the exchange rates in these emerging markets are generally more volatile than those of developed markets. As such, you should be aware that investments in emerging markets may subject to higher price volatility and therefore will tend to have a higher investment risk that will affect the target fund’s growth. We attempt to mitigate these risks through active asset allocation management and diversification across different countries and sectors, in addition to our continuous bottom-up and top-down research and analysis.
Risks associated with investment in warrants	There are inherent risks associated with investment in warrants. The value of warrants is influenced by the current market price of the underlying security, the exercise price of the contract, the time to expiration of the contract and the estimate of the future volatility of the underlying security’s price over the life of the contract. Generally, the erosion in value of warrants accelerates as it approaches its expiry date. Like securities, we will undertake fundamental research and analysis on these instruments with an aim to mitigate its risks.
