FUND MANAGER'S COMMENTS *

- March saw military action drive a clear transition in the risk set up facing investors. The goldilocks combination of improving growth and easing policy, which had prevailed over the opening two months of the year gave way to a more risk-off and stagflationary tone.
- The result saw the MSCI ACWI fall by -7.18% over March, reversing gains from the opening two months of the year to finish the quarter down -3.20%. At the epicenter was the closure of the Strait of Hormuz, and the resultant 70% surge in oil prices. The sudden removal of 20% of the World's oil supply reignited inflationary concerns, driving a sharp reversal in expectations for global rates cuts. The impact saw heavy losses across both equities and fixed income, as markets adjusted to a higher for longer rates environment. Investors were also left to digest the impact of higher energy prices on global growth.
- This constituted a considerable change relative to the start of 2026; January and February were characterised by moderating inflation and confidence that central banks (particularly the Federal Reserve) would soon begin cutting rates. This "soft landing" narrative supported falling bond yields and easier financial conditions. Through January and February this supported strong performance from global stocks led by cyclical parts of the market, such as industrials and materials. This broadening in market leadership helped to offset growing investor angst about rising capital expenditures and the disruptive impact of Artificial Intelligence on asset light business models. The latter dynamic played out via underperformance of IT, Consumer Discretionary and Financials. While Value outperformed Growth styles and international markets outperformed those in the US, in January and February.
- However, the outbreak of the conflict at the outset of March saw this constructive backdrop abruptly break down. Broad-based equity losses saw 10 out of 11 sectors drive losses over the month. This coincided with the Vix breaking through 30 for the first time since April 2025. Double-digit gains to Energy names stood out as a notable exception. Safe-haven status also saw US stocks regain their appeal vs international peers in March. Leadership along the style dimension also rotated towards a more defensive stance. This saw Growth recover some lost ground relative to Value. Elsewhere, the structural break in market direction saw fresh volatility in momentum styles.

STRATEGY:

- In terms of sector exposure, the Fund moved from underweight to overweight IT and increased underweights to healthcare and industrials.
- Along country lines, the largest country-related move was a reduction in the underweight to the US, and a smaller reduction to the overweight to Japan.
- In terms of style exposures, the Fund's overweights to residual volatility and momentum decreased.
- Overall, the Fund continues to maintain its defensive beta positioning and will continue to leverage the dividend rotation model and established options overlay process to deliver the 7%p.a. income target, which has been achieved each year since inception. During the first quarter, a number of beneficial changes were made: the overall weight of the machine learned model was increased, recently developed signals that time machine learned models were added, an EM-specific machine learned model was added, and within the themes bucket new bottom-up signals were added.

RISKS

All investment carries some form of risks. The potential key risks include but are not limited to the following:

Market risk	Market risk refers to the possibility that an investment will lose value because of a general decline in financial markets, due to economic, political and/or other factors, which will result in a decline in the target fund's NAV.
Liquidity risk	Liquidity risk refers to two scenarios. The first scenario is where an investment cannot be sold due to unavailability of a buyer for that investment. The second scenario exists where the investment, by its nature, is thinly traded. This will have the effect of causing the investment to be sold below its fair value which would adversely affect the NAV of the target fund.
Credit and default risk	Credit risk relates to the credit worthiness of the issuers of the bonds or money market instruments ("Investment") and their expected ability to make timely payment of interest and/or principal. Any adverse situations faced by the issuer may impact the value as well as liquidity of the Investment. In the case of rated investment, this may lead to a credit downgrade. Default risk relates to the risk of an issuer of the Investment either defaulting on payments or failing to make payments in a timely manner which will in turn adversely affect the value of the Investment. This could adversely affect the value of the target fund.
Interest rate risk	This risk refers to the impact of interest rate changes on the valuation of bonds or money market instruments ("Investment"). When interest rates rise, the investment prices generally decline and this may lower the market value of the Investment. The reverse may apply when interest rates fall.
Currency risk	<p>As the Investments of the target fund may be denominated in currencies other than the base currency, any fluctuation in the exchange rate between the base currency and the currencies in which the investments are denominated may have an impact on the value of these investments. Investors should note that any gains or losses arising from the fluctuation in the exchange rate may further increase or decrease the returns of the investment.</p> <p><u>Currency risk at the target fund level</u> The impact of the exchange rate movement between the base currency of the target fund and the currency of the underlying investments may result in a depreciation of the value of the investments as expressed in the base currency of the target fund.</p>

RISKS

All investment carries some form of risks. The potential key risks include but are not limited to the following:

Structured products risk

The NAV of the target fund will be impacted by the valuation of the structured product. Factors that may impact the valuation of the structured products will include, but not be limited to movement of the underlying assets, volatility of the underlying assets, interest rate levels, the correlation of the underlying assets and other such factors. Any change in the aforesaid factors would either positively or negatively impact the valuation of the structured products, hence impacting the NAV of the target fund. As such, the target fund's NAV will be exposed to potential price volatility, which will be dependent on the valuation of the structured products that the target fund invested in.

Country risk

Investments of the target fund in any country may be affected by changes in economic and political climate, restriction on currency repatriation or other developments in the law or regulations of the countries in which the target fund invests. For example, the deteriorating economic condition of such countries may adversely affect the value of the investments undertaken by the target fund in those affected countries. This in turn may cause the NAV of the target fund or prices of units to fall.

Regulatory risk

The investments of the target fund would be exposed to changes in the laws and regulations in the countries the target fund is invested in. These regulatory changes pose a risk to the target fund as it may materially impact the investments of the target fund. In an effort to manage and mitigate such risk, the fund manager seeks to continuously keep abreast of regulatory developments (for example, by closely monitoring announcements on regulators' website and mainstream media) in that country. The fund manager may dispose its investments in that particular country should the regulatory changes adversely impact the investors' interest or diminish returns to the target fund.
