FUND MANAGER'S COMMENTS

The Fund was up 2.40% in MYR terms in October, outperforming the benchmark by 174 bps. YTD, the Fund is up 13.97%, outperforming the benchmark by 735 bps.

The MSCI AC Asia Pacific ex Japan Index rose another 3.7% in October in USD terms. The best performing markets are Korea and Taiwan ROC and again mainly driven by news flow on AI investment which was guided higher. On the other hand, China and Australia lagged. US Fed announced a 25bps cut to its benchmark policy rate at its October meeting, lowering the benchmark policy rate to 3.75%-4% and the end of quantitative tightening beginning December 1. Balancing upside risk to inflation and unemployment risk, US Fed remains cautious, and Powell pushed back against expectations of another rate cut in December. Leading up to the APEC Summit in Korea, US and China trade tensions escalated but subsequently, Trump and Xi agreed to a trade truce for a year and US reduced China's effective tariff rate to 32%. Markets saw some relief from the easing of trade tensions. As the Asian markets have re-rated year-to-date, any occasional flare-ups in geopolitical tensions between US and China could lead to market volatility. China's Fourth Plenum sets the tone for the 15th Five-Year Plan, focusing on tech self-reliance, domestic demand, and improving livelihood via employment creation and housing stability. However, the macro economy remained challenged, which means that China requires renewed fiscal and monetary easing to cushion growth. In view of the strong market performance across Asia year-to-date, we are moderating exposures in areas where valuation and risk-reward dynamics have become less compelling. We are seeing more instances where companies are focusing on business simplification, asset rationalization and higher shareholder returns to improve productivity and deploy capital efficiently. This is positive as it makes potential returns less dependent on external factors like broad economic growth and we seek to identify such investment opportunities. The portfolio focuses on companies demonstrating market leadership, durable competitive advantages, strong free cashflows generation and/or attractive dividend yields. We remain constructive on financials, industrials, alongside technology leaders in internet platforms and semiconductors. Risks would be (1) sticky inflation, (2) global recession, and (3) rising geopolitical risks.

RISKS

All investment carries some form of risks. The potential key risks include but are not limited to the following:

Stock specific risk	Prices of a particular stock may fluctuate in response to the circumstances affecting individual companies such as adverse financial performance, news of a possible merger or loss of key personnel of a company. Any adverse price movements of such stock will adversely affect the target fund's NAV.
Country risk	Investments of the target fund in any country may be affected by changes in the economic and political climate, restriction on currency repatriation or other developments in the law or regulations of the countries in which the target fund invests. For example, the deteriorating economic condition of such countries may adversely affect the value of the investments undertaken by the target fund in those affected countries. This in turn may cause the NAV of the target fund or price of units to fall.
Liquidity risk	Liquidity risk refers to the ease of liquidating an asset depending on the asset's volume traded in the market. If the target fund holds assets that are illiquid, or are difficult to dispose of, the value of the target fund will be negatively affected when it has to sell such assets at unfavourable prices.
Currency risk	As the investments of the target fund may be denominated in currencies other than the base currency of the target fund, any fluctuation in the exchange rate between the base currency of the target fund and the currencies in which the investments are denominated may have an impact on the value of these investments. You should be aware that if the currencies in which the investments are denominated depreciate against the base currency of the target fund, this will have an adverse effect on the NAV of the target fund and vice versa. You should note that any gains or losses arising from the fluctuation in the exchange rate may further increase or decrease the returns of the investment.
Credit and default risk	The target fund will be exposed to a certain degree of credit and default risk of issuers or counterparties when the target fund invests in debt securities, money market instruments and/or place deposits. Credit risk relates to the creditworthiness of the securities issuers or counterparties and their expected ability to make timely payment of interest and/or principal. Any adverse situations faced by the issuers or counterparties may impact the value as well as liquidity of the investments. In the case of rated debt securities, this may lead to a credit downgrade. Default risk relates to the risk that a securities issuer or counterparty either defaulting on payments or failing to make payments in a timely manner which will in turn adversely affect the value of the investments. This could adversely affect the value of the target fund. Principal (S) aims to mitigate this risk by performing bottom-up and top-down credit research and analysis to determine the creditworthiness of its issuers or counterparties, and impose investment limits on exposures for issuers or counterparties with different credit profiles as a precautionary step to limit any loss that may arise directly or indirectly as a result of a defaulted transaction.

RISKS (CONTINUED)

Interest rate risk

Interest rate risk refers to the impact of interest rate changes on the valuation of debt securities. When interest rates rise, debt securities prices generally decline and this may lower the market value of the target fund's investment in debt securities. In managing the debt portfolio, Principal (S) takes into account the coupon rate and time to maturity of the debt securities with an aim to mitigate the interest rate risk.

Risk associated with investing in CIS

Since the target fund may invest entirely into CIS, there is a risk of concentration into CIS, in which the CIS's management company has absolute discretion over the CIS's investment technique and knowledge, operational controls and management. In the event of mismanagement of the CIS and/or the management company, the NAV of the target fund, which invests into those CIS would be affected negatively. Should the situation arise, Principal (S) will seek for another CIS that is consistent with the objective of the target fund.

Risk of investing in emerging markets

In comparison with investments in the developed markets, investment in emerging markets may involve a higher degree of risk due to the greater possibility of political or economic instability and societal tensions. Emerging markets are markets that are, by definition, "in a state of transition" and are therefore exposed to rapid political change and economic declines. The securities in the emerging markets may face a higher risk of price drop while the exchange rates in these emerging markets are generally more volatile than those of developed markets. As such, you should be aware that investments in emerging markets may be subject to higher price volatility and therefore will tend to have a higher investment risk that will affect the target fund's growth. Principal (S) will attempt to mitigate these risks through active asset allocation management and diversification, in addition to their continuous bottom-up and top-down research and analysis.
