

FUND OBJECTIVE

To provide a mixed exposure into equities and bonds, with higher allocation into equities.

INVESTMENT STRATEGY & APPROACH

The fund will feed into Sun Life Malaysia a Growth Fund and Sun Life Malaysia Conservative Fund according to a predefined asset allocation.

The Sun Life Malaysia Growth Fund combines a top down asset and sector allocation process with a bottom-up stock selection process. The asset allocation process is made after a review of macroeconomic trends in Malaysia and for the major economies. In particular, we consider the direction of GDP growth, interest rates, inflation, currencies and government policies. We next assess their impact on the various sectors, together with sector specific parameters to predict any discernible trends or themes. These trends or themes form the basis of our sector selection. Stock selection is based upon improving fundamentals and attractive relative valuations. Rising investor sentiment is an additional criteria. While we use a number of valuation methodologies, the price-earnings ratio is still preferred.

For the Sun Life Malaysia Conservative Fund, the strategy will be reviewed periodically based on the country’s economic and bond outlook. We will adopt an active trading strategy and will be especially selective in buying and selling of securities for the Fund. We formulate an interest rate outlook through examining factors such as the Malaysian inflation rate, monetary policies and economic growth. With an interest rate outlook and yield curve analysis, we identify the weighting of the investment tenure and credit rating for the Fund. As part of the risk management strategy, the Fund is constructed and managed within the predetermined guidelines. Essentially, we monitor the bond portfolio according to duration, credit ratings and sector.

FUND DETAILS

Launch Date	20 October 2008	Domicile	Malaysia
Currency	Ringgit Malaysia	Launch Price	RM1.0000
Units in Circulation	2.13 million units	Fund Size	RM5.91 million
Unit NAV	RM2.7783	Performance Benchmark	75% FBM100 + 25% 12 month FD

FUND MANAGER'S COMMENTS

In June 2026, the Fund's performance increased by 0.94%, outperforming the benchmark by 2.13%.

The FBM KLCI fell further 1.1% in June, but a wider 4% in USD terms due to the Ringgit weakness. YTD, the KLCI is down 1% in LCY and 1.6% in USD terms. Despite the de-escalation of the war in the Middle East, overall sentiment was dented by renewed hawkishness by the Fed through the new Fed Chair Kevin Warsh's maiden public address, with the market now expecting up to 2 hikes by end-2026. Consequently, the Dollar strengthened notably, which resulted in diminishing appeal of EM.

Malaysia's PMI reading improved from 49.9pts in May to 50.7pts in June. According to S&P Global, Malaysia's manufacturing sector saw fresh expansion in production amid renewed rise of new factory orders. That said, purchasing and hiring activities remained relatively muted as firms remain cautious and focuses on rebuilding margins following the war in the Middle East. Producers remain generally optimistic that output will expand over the next year. The latest PMI reading suggests growth rates for both GDP and official manufacturing production should trend higher in 2Q26. Malaysia's GDP grew 5.4% in 1Q26, marginally ahead of advance estimates. BNM forecast was 4.0-5.0% for 2026. We expect BNM to stay pat on OPR for the rest of the year at 2.75%. Inflation edged up further to 2.0% in May from 1.9% in the previous month driven by the increase in ICT, F&B and housing costs. The central bank forecast inflation of 1.5-2.5% for the year assuming no change to the RON95 subsidies.

The MGS yield curve moved modestly higher in the month of June, with the increase slightly more pronounced at the long end, resulting in a mild bear steepening bias. The 3Y and 10Y benchmarks rose by 3bps each, while the 30Y benchmark increased by 4bps. Meanwhile, the 5Y and 15Y tenors were largely unchanged.

RISKS

All investment carries some form of risks. The potential key risks include but are not limited to the following:

Market risk	Market risk is the risk of negative movement that affects the price of all assets in a particular capital market. The factors influencing the performance of the markets include: • Economic and financial market conditions • Political change • Broad investor sentiment • Movements in interest rate and inflation • Currency risks Stock and/or securities values fluctuate in response to the activities and performance of individual companies and general market or economic conditions. Such movements in the underlying values of the share of the investment portfolio will cause the NAV or prices of units to fall as well as rise. Market risk is mitigated through careful selection of securities and diversification through spreading of risk across a basket of assets and/or sectors.
Interest rate risk	Interest rates are inclined to fluctuate over time. A rise in the general level of interest rates will result in a decline of the value of all bonds and fixed interest securities. Hence a bond fund's NAV will most probably decrease with the rise of interest rates. Maintaining an appropriate diverse mix of assets with different yield and maturity profiles will lessen the impact of interest rate risk.
Liquidity risk	Liquidity risk is defined as the ease with which a security can be sold at or near its fair value depending on the volumes traded on the market. Liquidity risk is mitigated through the selection of stocks with an active trading volume in the open market. This ensures that exit strategies can be executed with little/minimal impacts to price fluctuations.
Company or security specific risk	There are many specific risks, which apply to individual companies or securities. Examples include the possible effect on a company of losing a key executive or the unforeseen entry of a new competitor into the market. The risk is mitigated by conducting in-house periodic reviews and analysis. In-house analysis is then supplemented by periodic reviews from rating agencies and market analysts.
Credit risk	Credit risk refers to an issuer's ability to make timely payments of profit and principal. In the event that the issuer of the instrument is faced with financial difficulties, leading to a decrease in their credit worthiness (i.e Bond prices will change/drop in the event of rating downgrade) and default in the payment of profit and principal, the value of the fund may be adversely affected. Credit risk is mitigated by conducting in-house periodic reviews and analysis. In-house analysis is then supplemented by periodic reviews from rating agencies and market analysts.
